3.1.2 CLARIFICATION: How The Graphics Cards Are Expected To Work

The statement “Base unit model must hold at least 2 of the discrete Graphics Cards below” is intended to mean that at least two (2) different cards from the list can go into the same workstation model number as options - either one or the other. It is not the intent that the workstation support two (2) graphics cards at the same time.

The goal is to allow for a wider variety of options in the District without adding more support channels, driver packs, firmware upgrades, and maintenance requirements into the system. The District is attempting to minimize the internal support cost generated by needing multiple models to fill various CTE roles. If one model number can hold most, or all, of these commonly desired cards, the support impact of offering options is reduced considerably.

Use as few model numbers as possible to cover 3.1.2.
Do not quote dual graphics card options for the builds. Desktops should only contain one (1) discrete graphics card per machine. There is no requirement for the workstation to have the capacity to power two (2) discrete graphics cards.
